Tabla 1.
Cuadro clínico de los pacientes con migraña infantil en el hemg – EsSALUD, 2010

Cuadro clínico	Nº	%
Cefalea no especificada	35	67,3
Cefalea pulsátil	17	32,7
Cefalea de localización focal	17	32,7
Cefalea de localización hemicráneo	8	15,4
Náuseas y vómitos	14	26,9
Foto y sonofobia	6	11,5
Trastorno de conciencia	5	9,6
Mareos	4	7,7
TDAH	4	7,7
Trastorno de conducta	3	5,8
Auras visuales	2	3,8
Convulsión febril	1	1,9

SeizureSpecialty Neurology and psychiatryeMedicine neuro/694a Notification Mother © dys [edit data on Wikidata] The seizure ©, in human and veterinary medicine, a transient symptom characterized by an excessive neuronal activity in the brain, leading to peculiar physical findings such as repeated contraction and shaking and distention o f one or more muscle types in an abrupt and usually violent manner, [1]is as well as changes in the subject's state of mind and mental disorders such as poor © vu or never vu. An epiphany crisis © It persists for several minutes. © known as status epilepsy, while epilepsy © the chronic recurrence of epiphany crises © Optics. Approximately 4% of the population will have an epiphany seizure © not provoked before the 80s and between 30 and 40%of them[2]; according to a study, 50% of patients will have a second epil seizure © Effective treatment can reduce to half the risk of a new seizure. © ptical[3]Patients with epilepsy are a t a risk of death two t o three times greater than expected in a population with similar characteristics, but without epilepsy[4]Treatment of an epistemic seizure © is part of the speciality of neurology and the study of epilepsy © the field of neuroscience. There are specialists dedicated exclusively to epilepsy in adults and children, who are called epileptics [5] Epiphany crises © tics are associated with a healthy © range of disorders and neurological diseases, the most common being epilepsy. However, an excessive association between seizures and epilepsy may have led to that 30% of people diagnosed as an epiphany © Medicated for this purpose do not pass from people who suffer from a certain seizure due to anxiety (according to the journal Neurology in number 13). Classification See also © m: Types of Classification of epile crisis Á © CIF Petitions, ILAE 2017 [6] Aventaís Starting in 2017, the epilised crisis are classified as if yes, if so if it is focused, Generalizo r unknown, and according to whether they are start-up or motor no. The focal onset crises in turn are classified according to whether or not they present a commitment of awareness. EM Geral, but not always, the S crisis crisis is associated with disorders that cause structural and localized abnormalities of the brain, while the generalized crisis can be the consequence of cellular abnormalities, bioqui ÁJ Á © MICAS OR STRUCTURALS THAT HAVE BUCIÁ²nean Muco Mco Lien. Pathogenesis Epil Epil Crisis Filho Stifestations S Á Vitas de la S discharges The Sincrian levels of a group of neurons of the cerebral cortex or bark in general . UMA CRISE EPIL EPIL THERE IS THE RESULT OF UM SUPPRONE EXCITATORY FROM AS EXCITATORY FOR FORMS AND INSIBERS OF THE NETWORK NETWORK NET OF THE CORTIOUAL EXCITTATION WITHOUT Synchronized potential of the excitatory potential. [4] Ambienting] The epilisis crises can cause motor manifestations (automatisms, myoclonies, among others) and non-motor (autonic, cognitive, emotional, among others). [6] ecologic Logic Logic: Epilttasis Crises can Ter COM a temporary event or crisis gattle, such as expositive afmners or drugs such as coca at E-o-na, amphetamines , NEW ONLY, ABSITY OF HIGHT AO BIT OF CONSUMPTION, LIQUOR OR AHRMACOS, CONTIARS AS ABRABIT BENZODIAZEZINAS, A HIGH FEVER IN NI NI CNICA OS ANORMAL SYODIAL LEVELS OR GLUCOSA IN the blood. Seizures can be an S E O-ntheal cell disease or gluten sensitivity not celá²here not diagnosed-ACA, which can give the nervous system to study without SÁ²nitome s Appreciable digestive Em cases, um injury to the brain, for example, um cerebrovascular or in the CR IÁ²NO, it causes the the neuron neurons in the cerebrales. In some personas, there may be hereditary factors affecting the neurons of the brain in such a way that conjecture that the present disposition of the epi crisis is © Whoa! © Optics. In this case, the crisis follows spont spont neatly, in an immediate cause F it takes time. In other cases, it can make haber malformaciones del desarrollo cerebral originated during the embryo. © Neis. Other frequent causes of epi-crisis © Topics include: Brain tumors and otras structural lesions of the brain, such as the increase of intracerebral pres. Nurses that cause a deterioration of the brain. Dementia, like la Alzheimer's disease. Hepatic insufficiency of the renal. Infections (absence) © cerebral sio, meningitis, encephalitis, neurosis-philis, AIDS, among others). La phenylketonuria can cause an epil crisis © Drinking conditions en los © Crisis focuses La characteristic neuronal classical of the seizures focal to the appearance in the electroencephalogram of boss of interictal epileptiforme, decir, a thipungud wave. Ello correlates with a cellular discharge of neurons in controlled cortical exchange rates of depolarization and paroxysm,[11]quest to relocate with a prolonged depolarization dependent on calcium resulting in the appearance of the psis of last potentials of sodium-mediated actuation, followed by a prominent hyperpolarization of the Basal Levels of the spare potential. His various neurons are suman in epileptiforme interictales synchronized, el electroencephalogram registers an interictal punt. Those genius of an epil crisis © incr © Module La producci of an epiphany crisis © Dog © It is difficult to predict symptoms depending on the affected neuronal zone. If the Red Neuronal affects visual courtship, it's not like any of the manifestations will be exposed to visual manifestations. And the other regions of Courtesy: taste, taste, Or Motors. Seizures are often associated with sudden involuntary contractions of a group of muscles and loss of consciousness and behavioural disorders. Uma crise epil ÁÁ²ptica can last from a few seconds to a state epileptic, uma crise epilÁÁ²sica tica, Motora n o Motora, que n ÁÁ²fo usually stops without medical intervention. embargo of sins, uma crise epil ÁÁ²tica can be as subtle as numbness of a part of the body, a short or long-term memory pÁ²ria rdida, flickering or bright, the perception of unpleasant odors, Uma extra ÁÁ²fo envolve uma sensaci ÁÁ²n epig ÁÁ²trica a uma sensaciÁÁ²n of fear or fear with a state of confusion which in some cases lead to death during a crise. Desired for an epilec seizure, usually follows a state of disorientation or amnesia of a few minutes or an hour of duration, called the most ictal state. Some patients able to tell when a crise est ÁÁ²; um point to occur. Some of the s ÁÁ² IÁÁ²fo experienced by the person before uma crise include dizziness, pressure on the chest, reverse ocular IÁÁ²Áo, the momentary experience of things moving in cÁÁ²a agomara slowly some patients emit a gaiety. Severe acute rash before-seizure ÁÁ². Inalg uncacos, A aparici ÁÁ²n of a crisis is anticipated given by some of the feelings described above. These sensations can then serve as a warning to the patient that uma crise epil ÁÁ²ptica is about to occur. These, "sensations of alert" filho called altogether aura, and corresponding to the beginning of the crisis. [13]Gettiná The s ÁÁ²fo-entomas experienced by a person during a crise, as well as the nature of the aura, depend on whether or not the area of the brain is affected by dysfunctional activity. If the crisis originates ÁÁ² by discharges at the level of the temporal bulb, the patient usually has sensations as abdominals a d © IÁ²Á © jÁ²fÁ © 150; either smells or a few flavors as well as sudden feelings of happiness or sorrow. If it occurs in the frontal lobe, you usually feel an outbreak in the head, stiffness or tremor in some part of the body, such as an arm or hand. Those in the parietal lobe may include loss of sensation or tingling in some part of the body or that one of the members looks heavier or lighter than usual. While the occipital lobe may be associated with visual disturbances such as flashing lights or bright colors and hallucinations. Recent studies show that seizures © During sleep conditions happen more often than previously thought. The patient with a nico-clonic seizure may have a conscious commitment, fall t o the ground, convulse, often violently, and become cyanotic [15] A person with a focal seizure with commitment of consciousness may appear confused or stunned and unable to answer questions or commands. Some people have crises that are not perceptible t o others. Sometimes the only indication that a person is having a seizure is not © more than a quick blink, an extreme confusion that lasts a few seconds o r sometimes hours. Classic picture of feverish seizures See also © feverish seizures A feverish convulsion usually occurs when there is a rapid increase in body temperature for C o r more, usually generalized tonic-clonic seizures. It begins with a single loss of consciousness, followed by a single contraction of the muscles, followed by classical movements of duration usually of 10-30 seconds, but the total crisis can last until © 15 minutes or may not decrease, constituting a feverish state of epilepsy. This is © usually followed by a period of sleep. Simple feverish seizures A simple feverish apprehension occurs when a child has an apprehension al less than 15 minutes, y within them 24 hours no replying. Come on, man. © technique with the previous paragraph a neuron effect and febrile episode is caused by fuera of the central nervous system. The United States of America © Latin Am e rica and the United States of America © Latin, as well as the countries of Amman © Latin and Amman rich © Latin, as well as the countries of Amman © Latin and Amman rich © rich Latina. It's a retraction in el desarrollo psychomotor. A preexisting neurological disorder. It is calculated that alrededor from 75 to 80 Josu.% from simple son's fever convulsions. Fortunately, these simple, harmless son seizures are febrile and there is n o evidence that dices seizures cause her death, brain damage, epilepsy, mental retardation, mental dyskinesia of the intellectual cocient the problem of learning. [1]Adventure; "Febrile crisis completes Las febrile seizures and completes at least one convulsi o n of longer than 15 minutes the repeated seizures within 24-hour intervals of the first episode". [1]ndagant] Deserter © A complicated feverish convulsi o n, the laughter of repeating epilepsy in her life a few months ago. © Al elevated. If the seizures rebound, if you start a pharmacological treatment, you need to investigate the cause. Epiphany © Various changes already existing as el S © Dravet's ndrome o la epilepsy en niltes as © epileptic ndrome en ni © yi as mental con/sin in that regard an important crisis denante, also © Whoa! © in las madallas GEF+ (febrile convulsions plus), "The Prefecture of las febrile convulsiones, benign son." The Hay otras denominations for the complex feverish seizures, such as seizures, seizures and seizures. © I'll have it translated in a literal way. © Momi © is racially convulsing en serie, this convulsion convulsive seizures When hay muchas convulsiones en un solo d-a-a, se puede dar en distinct types of epilepsy, pero son muy frecuentes en el S Ao-ndrome de Dravet o la epilepsia en niéniÁ² one-ndrome epileptico en ni© a cao uncrivel mental con/sin retraso. Treatment.The main recommendi a³n for the patient with recurring convulsions without provocate the anticonvulsant. Si un individuo ha tenido m is 1 convulsive episodium, se indica la administraci Á³n del anticonvulsivantes. By el contrario, la principal recommendi n for patients with patient su primer y only episodio convulsivo el avoid los precipitantes m Á³s vital, including the alcaucz y la lack of sueone sin la indicati It is of anti-convivantes unless the subject tenga factor of riesgo for a recurrence, otra cosa that the patient tiene that avoid son los coups, es la mayor causa de convulsiones. Los principales markers de un alta riesgo de recurrencia, desde un 15 a un 70% Mayor que la poblaci ÁÁ³n general, inclusive im Á³genes abnormales en la resonancia magn cia© cia© tica, un registrar abnormal en el electrofolograma realiza la vigilia o que a convulsi Á³ria haya ser focal. Some antiepil Ehanis pticos, entre ellos lamotrigina, el topiramato, el acido valproico y zonisamida tienen m Á³tiples mechanisms of acci Á³nea, mientras que otros, como la phenito Á-na, carbamazepina y la etosuximaida solo tienen un mechanism de acci Á³n. La diet sin gluten ni-80 os confermedad cel-a o sensibilidad al gluten no celá²aca consigue un mejor control de la crisis, lo que allows a reducci cia in la medicaci Á³nean.[16] On the left left [8] If consiguen los mejores results cuanto minor mar el retraso en la withdrawal del gluten de la diet. Ausencia crisis Las convulsiones de ausencia solas sueser treated with etosuximide. If accompanied by one of the other forms of convulsions, if suele indicates valproate, lamotrigina the topiramate. Not indicatedgabapentin the tiagabina because it is demonstrated that son drugs that exacerban las crisis de ausencias.[12] véase también chorea gravidarum epilepsia neurological disorders related to gluten epilepsia photosensitiva mertrrrf narcolepsy syndrome of gobbi Lennox-Gastautmar syndrome of dravet and 2009.
